Orig Pub : Sabiranje i transport nafte. Nafta (Zagreb), 1955, 6, No3
87-93 (Serbo-Croatian; English summary)

Abstract : Presented are calculation and graphic data on viscosity
of crude petroleum at different temperatures; considered
are the technical specifications of collection and
transportation, by means of pipe lines, of viscous pe-
troleum, and, in particular, the method of heating pipe
lines with electric current (taking into account the ex-
perience gained in Canada and German Federal Republic).

TITLE:

Case hardening of chromium stainless steels in a solid carbonizer

PERIODICAL:

Referativnyy zhurnal, Mashinostroyeniye, no. 15, 1962, 19 - 20,
abstract 15B123 ("Uch. zap. Permsk. un-t", 16, no. 4, 1960, 27 - 32)

TEXT:

Experiments on case hardening (at 950 - 1,050°C) were carried out on 1X13 (1Kh13) and X17H2 (Kh17H2) stainless steel samples. Ammonium chloride was added to the charcoal carbonizer and the samples were parkerized preliminarily in a zinc phosphate solution bath. After case hardening the microstructure of the case-hardened layer and its hardness (in all processes of more than 1 hour duration, HRC = 59 - 63) were investigated. As a result of the investigation the possibility of case hardening chromium stainless steels with 13 and 17% Cr in a solid carbonizer with a preliminary parkerization of the surface was established. Furthermore, it has been shown that the decrease of hardness of the case-hardened layer below HRC 58 is connected with the disappearance of excess carbides and with a decrease of the carbon content (below 0.4 - 0.6%) in the mar-

furnace of a new design which operates according to the spouting principle, with a directionally circulating layer of coal. The furnace (a vertical steel pipe 150 mm in diameter and 1000 mm long) has an axial nozzle, 25 mm in diameter and 500 mm in length; through the nozzle flows the gas serving as heat-transfer agent (low-temperature retort coal gas), which entrains the coal particles that spout in the free area of the furnace above the nozzle and fall into the annular zone of the furnace, around the nozzle, where they form a dense descending layer; in the bottom part of the furnace the descending particles of coal (semi-coke) are again picked-up by the hot gas

and ejected, through the nozzle, into the upper part of the furnace. The low-temperature retort coal gas on leaving the furnace passes through a system of dust- and tar separators and is then driven, by a blower, through a battery of electric heaters, from which it is returned, after being heated to a temperature of 600-700°, into the furnace. Excess gas and the semi-coke are withdrawn from the system. Yield of primary tar produced in this unit, at a carbonization temperature of 450-500°, amounted to 80.5% of the laboratory yield (obtained in an aluminum retort). It is reported that this procedure of low-tempera-

AUTHOR: Taskayev, N. D.

TITLE: Briqueting of Almalyk Coal, Kirgizskaya SSR
(Briketirovaniye uglya mestorozhdeniya Almalyk Kirgizskoy SSR)

PERIODICAL: Tr. in-ta khimii AN KirgSSR, 1957, Nr 8, pp 137-142

ABSTRACT: Almalyk-field coal is a young brown coal, mechanically weak and inclined to self-ignition. Optimum briqueting conditions were determined, as well as the briquet quality for the coal with fraction dimensions 0-1, 0-3, and 0-5 mm, with a moisture content of 24, 20, 14, and 10%. Pressures of 1,000, 1,500, and 2,000 atm were used for briqueting. Briquet mechanical properties were determined by compression and bending tests. It was found that Almalyk-field coal can be turned into a mechanically-stable briquet with a compression strength up to 115 kg/cm² and a bending strength up to 10.2 kg/cm² under the following conditions of pressing: coal size 0-1 mm, moisture content 10%,

TITLE:

The dynamics of sublimation of Sb compounds from lean sulfide oxidized ores

PERIODICAL:

Referativnyy zhurnal, Metallurgiya, no. 6, 1962, 24, abstract 66186
("Izv. AN KirgSSR. Ser. yestestv. i tekhn. n.", 2; no. 11, 1960, 159 - 164, Kirghiz summary)

TEXT:

Experimental works were carried out to establish the effect of the temperature and the granulometric composition of ore on the process of Sb sublimation. At the same time the effect of the atmosphere on the depth of sublimation process was investigated. For an Sb-ore the Sb sublimation should be carried out at 1,200°C. A reducing atmosphere facilitates the process of Sb distillation and decreases the temperature of the process by more than 200°C. The granulometric composition of ore affects the depth of metal recovery at up to 1,000°C (independently of the character of the atmosphere). Steady conditions of Sb distillation at > 1,100 - 1,200°C speak for the advisability of carrying

TITLE: Influence of the Radio-active Irradiation on the Formation of Ultra high-frequency Pulse Discharges (Vliyaniye radio-aktivnogo oblucheniya na vzniknoveniye impul'snogo sverkhvysokochastotnogo razryada)

PERIODICAL: Radiotekhnika i Elektronika, 1958, Vol III, Nr 5, pp 704 - 709 (USSR)

ABSTRACT: The measurements reported were carried out by means of the equipment described in the present issue of the journal, pp 689 - 703. The measurements were made at a wavelength of 3.2 cm and the ionising source was either Co⁶⁰ emitting γ-rays or producing α-particles. It was found that the statistical time lags obeyed the formula:

$$N = N_0 e^{-\frac{t}{\bar{t}}} \quad (4)$$

where N is the number of the tests in which the delay is greater than t, N₀ is the overall number of tests and \bar{t} is the average statistical delay time; the experimental curve

Card 1/3

109-3-5-13/17

Influence of the Radio-active Irradiation on the Formation of Ultra-high-frequency Pulse Discharges

showing the above relationship for a pressure of 45.3 mmHg for the γ -source is plotted in Fig.1. Fig. 2 shows the value of τ_3 as a function of $1/A$ (where A is the intensity of the radiating source) for various values of the pulse power fed to the discharge space; W_0 in Fig. 2 denotes the value of the breakdown power. From Fig.2, it is concluded that τ_3 is linearly dependent on $1/A$ and that τ_3 decreases with increasing power fed to the breakdown region. On the other hand, it was found that for a very wide range of variation of the activity of the γ -rays, the breakdown power was practically constant. Similar results were observed if Po^{210} was used as the ionising source in spite of the fact that an α -particle produces about 500 times more electrons than a γ -ray from Co^{60} . It was also observed that in the presence of Po^{210} , the delays were also governed by the same statistical law. A curve of the breakdown power W_{pr} as a function of pressure was determined for both the ionising sources and

Card2/3

109-3-5-13/17

Influence of the Radio-active Irradiation on the Formation of Ultra-high-frequency Pulse Discharges

this is shown in Fig.3. It is seen that the value of W_{pr}

is independent of the nature of the ionising source.

There are 3 figures and 5 references, 4 of which are Soviet and 1 English.

TITLE: Spectrochemical method of determining microquantities of indium in process
solutions

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 11, 1965, 1204-1207

TOPIC TAGS: indium, lithium, spectrographic analysis, metal extracting, trace
analysis

ABSTRACT: A spectrochemical method is proposed for determining traces of indium in
the process solutions of the lead and zinc industry. The indium is first extracted
with alkylphosphoric acids and the extracts are introduced into the arc of a ISP-28
quartz spectrograph and photographed. Lithium was used as the reference element. The
analytical lines were In I 3256.09 and Li I 3232.61. The preliminary extraction of
indium with alkylphosphoric acids markedly increases the accuracy of the determina-
tion. The reproducibility of the proposed spectrochemical methods is characterized
by variation coefficients of about 4.5%. The authors are deeply grateful to I. S.

"Therapeutic Effect of Some Antibiotics in Dysentery and Typhoid Fever."

Sofia, Suvremenna Meditsina, Vol 14, No 5, 1963; pp 21-24.

Abstract : Data on 708 patients with dysentery and 145 with typhoid fever, treated with various antibiotics of the chloramphenicol, streptomycin and tetracycline groups; chloramphenicol was most effective, streptomycin least. Sulfathiazole was used in conjunction. In vitro tests were not always reliable predictors of clinical response. Effects generally good but recurrences may be even more frequent with antibiotic treatment - thus 13% of 145 antibiotic-treated patients had recurrences but none of 30 patients with typhoid fever treated without antibiotics.

Urease and its activators as inhibitors of heavy metal catalysis. Tomislav Pinter, Divna Taskovska, and Vinka Karna (Med. Fac., Zagreb, Yugoslavia). *Biochem. Z.* 325, 239-45 (1954).—Urease is inhibited by various heavy metals (Hg, Ag, Cu, Cd, Pb) and its various activators (proteins, amino acids, gum arabic) owe their action to the fact that they bind the heavy metals. It is demonstrated that these activators and urease actually inhibit the catalytic action of Hg^{++} , Ag^+ , or Au^{++} on the decompn. of ferrocyanide ions.
